

Employee Laptop Request Management System

Project Documentation

16. Update Set Deployment & Migration

16.1 Objective

The objective of this activity is to package, validate, and migrate the Employee Laptop Request Management System configurations from the development instance to another ServiceNow instance using an Update Set.

The HR Onboarding Application Update Set was used to collect the configuration changes developed during the project.

16.2 Update Set Contents

The following application components were verified in the Update Set:

Component	Included
Custom Application	Project Application
Custom Table	Laptop Request Form
Table Fields	Requester, Manager, Type, Status, Reason, etc.
Record Producer	Laptop Request
Business Rules	Laptop Request validation
Roles & ACLs	Manager and Employee access
Flow Designer	Approval workflow
Notifications	Email notifications

This verification ensured that the required application configuration was included before migration.

16.3 Update Set Validation

Steps

Opened the HR Onboarding Application Update Set.

Reviewed the configuration records included in the Update Set.

Verified that the required application components were captured.

Checked the Business Rules, ACLs, Record Producer, and Flow Designer configurations.

Confirmed that the required notification configurations were included.

16.4 Update Set Preview

Before committing the Update Set to the target instance, an Update Set Preview was performed.

Purpose

The Preview operation checks whether the configuration changes can be applied successfully to the target instance.

It can identify issues such as:

Missing dependencies

Conflicts with existing configurations

Duplicate configuration records

Application scope conflicts

Other migration-related issues

Steps

Opened the Update Set in the target instance.

Selected Preview Update Set.

Reviewed the preview results.

Identified configuration conflicts.

Resolved the reported conflicts.

Re-ran the preview to verify that the Update Set was ready for commitment.

16.5 Resolving Conflicts

Any conflicts identified during the Update Set Preview were reviewed and resolved before deployment.

The configuration was revalidated after resolving the conflicts to ensure that the target instance could accept the Update Set successfully.

Result

The Update Set was successfully prepared for deployment.

16.6 Completing the Update Set

After successful validation:

The Update Set state was changed to Complete.

The completed Update Set was prepared for migration.

The Update Set was exported as an XML file.

XML Export

The exported XML file contains the configuration changes captured by the Update Set and can be imported into another ServiceNow instance.

16.7 Sharing the Update Set

The exported XML file was downloaded and transferred to the target environment through an approved file-sharing mechanism.

For project/demo environments, the file can be transferred using available file-sharing or collaboration applications.

Note: For production environments, Update Set files should preferably be transferred through controlled organizational channels and ServiceNow-supported deployment processes rather than informal messaging applications.

16.8 Importing the Update Set

The XML Update Set can be loaded into the target ServiceNow instance.

General Process

Development Instance

Resolve Conflicts

Commit Update Set

Validate Application

16.9 Post-Deployment Validation

After migration, the application configuration should be validated in the target instance.

Validation Checklist

Project Application is available.

Laptop Request Form table exists.

Required fields are available.

Laptop Request Record Producer is available.

Business Rule is active.

Roles and ACLs are configured.

Flow Designer approval process is available.

Email notifications are configured.

Employee can submit a laptop request.

Duplicate request validation works.

Manager approval is triggered.

Request status is updated correctly.

Notifications are generated correctly.

16.10 Deployment Outcome

The HR Onboarding Application Update Set provided a controlled method for packaging and migrating the Employee Laptop Request Management System.

The deployment process included:

Development → Update Set → Validation → Preview → Conflict Resolution → Complete → XML Export → Target Instance → Preview → Commit → Testing
