

Project Documentation

Key Achievements & Skills Demonstrated

31. Key Achievements

The Laptop Request Management Application successfully implements an end-to-end request management process in ServiceNow. The project integrates application development, business rules, role-based security, approval automation, and deployment practices.

31.1 End-to-End Automated Request Lifecycle

Implemented a complete laptop request lifecycle starting from employee request submission through the Service Catalog.

The process includes:

Employee → Service Catalog → Laptop Request → Validation → Manager Approval → Request Processing

This provides a structured and automated approach for handling employee laptop requests.

31.2 Role-Based Security with ACLs

Implemented role-based access control using Roles, Groups, and Access Control Lists (ACLs).

Two roles were configured:

it_employee – Allows employees to create, view, and modify laptop requests.

it_manager – Provides managers with read-only access to laptop requests.

This ensures that users can access only the functionality appropriate to their responsibilities.

31.3 Policy Enforcement Through Business Rules

Implemented a Business Rule to enforce the organizational policy that an employee can submit only one laptop request per calendar year.

The Business Rule:

Checks the requester.

Checks requests created during the current year.

Identifies duplicate requests.

Prevents duplicate submissions.

Displays an appropriate error message to the user.

This provides backend-level enforcement of the business policy.

31.4 Seamless Approval Using Flow Designer

Implemented approval automation using ServiceNow Flow Designer.

The approval flow is designed to:

Trigger when a laptop request is submitted.

Identify the appropriate manager.

Send the request for approval.

Capture the manager's approval decision.

Continue the request process based on the approval result.

This reduces manual intervention and provides a consistent approval process.

31.5 Clean Deployment Using Update Sets

Used Update Sets to capture and manage application configuration changes.

The Update Set helps package configuration components such as:

Custom application configurations

Tables and fields

Business Rules

ACLs

Relationships

Catalog configurations

Flow-related configurations

This supports controlled movement of application configurations between ServiceNow instances.

32. Technical Skills Demonstrated

This project demonstrates practical knowledge in several important ServiceNow areas.

ServiceNow Application Development

Experience gained in:

Creating scoped applications.

Creating custom tables.

Creating custom fields.

Configuring application components.

Using ServiceNow Studio.

Working with application scopes.

Backend Logic & Security

Experience gained in:

Business Rules.

GlideRecord.

Server-side scripting.

Role-based access control.

ACL configuration.

Groups and roles.

Table-level security.

Service Catalog

Experience gained in:

Catalog Items.

Record Producers.

Catalog variables.

Variable-to-field mapping.

Service Catalog configuration.

Workflow Automation

Experience gained in:

Flow Designer.

Approval automation.

Request lifecycle management.

Manager approval processes.

Deployment & Configuration Management

Experience gained in:

Local Update Sets.

Capturing configuration changes.

Managing application changes.

Preparing configurations for deployment between instances.

33. Project Highlights

Area	Implementation
Application	Custom scoped ServiceNow application
Table	Laptop Request Form
Service Catalog	Employee Service Catalog
Record Producer	Laptop Request
Business Rule	One request per employee per year
Roles	it_employee, it_manager
Groups	IT Employees, IT Managers
Security	Table-level ACLs
Approval	Manager approval using Flow Designer

Area	Implementation
Relationship	Laptop Request → Approval records
Deployment	Update Set

34. Overall Project Outcome

The project successfully demonstrates how ServiceNow can be used to build a secure, automated, and maintainable enterprise request-management application.

The solution combines:

Service Catalog + Custom Application + Business Rules + ACLs + Roles & Groups + Flow Designer + Approval + Update Sets

to create a complete laptop request management solution.

Key Learning Outcomes

Through this project, the following practical skills were demonstrated:

ServiceNow application development

Scoped application configuration

Table and field creation

Service Catalog development

Record Producer configuration

Server-side scripting

GlideRecord

Business Rule development

Role and group management

ACL-based security

Flow Designer automation

Approval process configuration

Update Set-based deployment

35. Conclusion

The Laptop Request Management Application provides an end-to-end solution for managing employee laptop requests. It combines automated request submission, backend policy enforcement, role-based security, manager approval, and controlled deployment.
